

Personal Finance Coaching Database

For this project, I've chosen a Personal Finance Coaching Business. This system models the operational data required for a financial coaching firm that pairs clients with professional advisors, tracks custom savings targets, and logs daily financial transactions to help individuals manage their budgets and reach their monetary goals.

System Design Requirements

The system needs to capture four primary pillars, personnel management (coaches), customer profiles (clients), target milestones (savings goals), and monetary tracking (transactions).

Coaches

- *Purpose:* To store professional details of the financial coaches working for the firm

Fields Required:

- Coach_id (Primary Key)
- First_name
- Last_name
- Specialty (Area of Financial expertise)
- Email

Clients

- *Purpose:* To manage individual customers who sign up for coaching services. Each client is monitored by one assigned coach.

Fields Required:

- Client_id (Primary Key)
- First_name
- Last_name
- Email
- Phone
- Coach_id (Foreign Key linking the client to their specific coach)

Savings Goal

- *Purpose:* To track specific financial milestones that clients are working towards (e.g., buying a car, building an emergency fund).

Fields Required:

- Goal_id (Primary Key)
- Client_id (Foreign Key linking to the specific client who owns it)
- Goal_name (Description or title of the savings target)
- Target_amount (The total monetary amount to achieve milestone)
- Current_amount (current amount client has saved towards milestone)
- Target_date (The deadline date to reach milestone)

Transactions

- *Purpose:* To record cash flow entering or leaving the client's accounts to monitor budgeting habits.

Fields Required:

- Transaction_id (Primary Key)
- Client_id (Foreign Key linking to each client)
- Category (Classification of spending or earnings, e.g., Groceries, Rent, Salary)
- Amount (total amount of each transaction)
- Transaction_date (the day the transaction took place)
- Type (Indicates whether the transaction is an 'Income' or an 'Expense')

Relationships Summary

- Coach to Client (1-to-Many): One coach can guide multiple clients, but each client is assigned to only one primary coach.
- Client to Savings Goal (1-to-Many): A single client can set and track multiple savings goals, but each goal belongs to one specific client.
- Clients to Transactions (1-to-Many): A single client can have numerous financial transactions recorded, but all transactions are tied to one specific client.
